Base SE is a carefully selected blend of hydrocarbon oils, ethoxylated lanolin and vegetable based fatty alcohol to produce a pale yellow, unctuous substance that is extremely hydrophilic and will form stable, non-ionic o/w emulsions with great ease.

Base SE can be used as a general-purpose base for a wide range of cosmetic and pharmaceutical applications, providing not only the emulsification power, but emolliency and lubricity to cream and lotion formulations. In clinical applications, **Base SE** can also find uses as a carrier for actives such as antiseptics, hydrocortisone, etc.

All the components used in **Base SE** have a long history of proven acceptability and dermatological safety on the skin.
